

KPIs Being Calculated

1. Total Revenue

Before calculating the revenue I had to transform my data using power query and made sure my data is consistent,

- Calculation: Sum of the total price of all pizza orders.
- What it measures: The overall sales income generated from pizzas.

2. Average Order Value

Before calculating the Average I had to add a new measure to calculate Total orders

- Calculation: $\text{Total Revenue} \div \text{Total Number of Orders}$.
- What it measures: The average amount a customer spends per transaction.

3. Total Pizzas Sold

- Calculation: Sum of the quantities of pizzas sold.
- What it measures: The total volume of pizza units sold.

4. Total Orders

- Calculation: Total number of orders placed.
- What it measures: The overall number of transactions.

5. Average Pizzas Per Order

- Calculation: $\text{Total Pizzas Sold} \div \text{Total Number of Orders}$.
- What it measures: The average number of pizzas purchased in each order.

Chart Requirements & Descriptions

I had to go back to the data set and open power query to transform my data again, I added a new column and named it Order day when it had days of the week and I also added a conditional column where by I numbered the days of the week stating with Sunday as the 1st day.

And also added another column with only 1st three letters of the days.

This is important when you want to sort your graphs

1. Daily Trend for Total Orders

- Chart Type: Bar chart
- What it displays: Daily trend of total orders over a specific time period
- Purpose: Helps identify any patterns or fluctuations in order volumes on a daily basis (e.g., which days of the week have higher or lower orders)

I also had to transform my data again since on the data set there was no table for months, I used the same method as the previous step

2. Monthly Trend for Total Orders

- Chart Type: Line chart
- What it displays: Hourly trend of total orders throughout the day
- Purpose: Allows identification of peak hours or periods of high order activity (e.g., lunch or dinner rush)

3. Percentage of Sales by Pizza

Category

- Chart Type: Pie chart
- What it displays: Distribution of sales across different pizza categories
- Purpose: Provides insights into the popularity of various pizza categories and their contribution to overall sales (e.g., Classic, Supreme, Veggie, or Chicken pizzas)

Best/Worst Sellerrs

I also calculate and found best sellers by Revenue, Quantity, and Total Orders, on this one I found best 5 also bottom 5 Sellers.

I also found out which category was the worst seller and which was the best and which month were those.
